It differs from the other large spore species in its more vigorous and rapid growth with a fluffy centre in cultures. The other species presents large and unequally-sized spores. He also found in one cultivation black, and in another rose-colored, spores that are thought to be forms found only in animals. He found that he would have to make many attempts before succeeding in inoculating some subjects, and that the patient must have an alkaline reaction to his sweat before success can be obtained. The hair in ringworm of the scalp is early affected. the first point attacked being, according to TAYLoR (486) that portion of the shaft immediately on a level with the surface of the

skin, from which point it spreads up and down. The cortical substance in its peripheral part is the most frequent and earliest seat of the fungus; but the whole hair is frequently involved. According to most observers the bulb is invaded to only a slight extent and the papilla and root-sheaths are spared. A. R. RoBINSON (33) has met with the spores and mycelia in the root-sheath and even in the perifollicular tissue. However, as a rule it may be stated that the part of the hair most infected is above the neck of the follicle. It grows up to a long distance in the shaft, but seldom if ever to the point of the hair. When present in the hair, in small amount, the hair preserves its cuticle entire, and looks scarcely altered. When present to such an extent as to cause fracture of the hair and the formation of stumps, the cuticle will be broken, the whole stump will be disorganized, and its end frayed out. Often the hair under the microscope seems as if it had burst at many points and allowed the spores to...
